

Feedback – AI Survival Kit for Professionals: Software Engineering Edition

Lucca Lacerda - Introduction to Algorithms Professor: “I thought it interesting. However, since it’s a survival kit, it would be good to explain what AI actually is—to demystify it a bit and show why there’s no need to fear it—and perhaps include some AI-specific characteristics, such as generic text or AI-generated code (which often lacks established security standards unless specifically requested in the prompt). Overall, though, it turned out very well, and the design looks great too.”

Emanuelly Oliveira - Classmate: “I thought it very cool, very nice, and easy to read. I'm not fluent in English, and I was able to read most of it without any problem. I really liked the points presented and the visual characteristics of the document.”

Ítalo Carneiro - Classmate: “At certain points in the slide deck, you highlighted things that might seem obvious to us but often get overlooked—like not relying 100% on AI for everything but rather using it as a copilot to assist with repetitive, mechanical tasks. I think you did a great job explaining the pros and cons of constant AI usage, avoiding a scenario where programmers just slip into "vibe coding." I also really liked the section on tools; there were several I hadn't even heard of, and you clearly explained the value each one brings to a software engineer and the situations where it makes sense to use them.”
